

1. Suppose `queue<int> q` contains 6 elements 1, 2, 3, 4, 5, 6 (enqueued in that order). What is the result of executing the following code snippet? (Assume member function `front()` returns the value found at the front of the queue without removing it.)

```
for(int i = 1; i<7; i++){
    if(i%2==0) {
        q.enqueue(q.front());
        q.dequeue();
    }
}
```

- A. The odd numbers in `q` are reversed.
- B. The even numbers in `q` are reversed.
- C. The elements `q` are reversed.
- D. **[Correct Answer]** **[Your Answer]** The front half of the original `q` is now at the back half.
- E. `q` remains the same.

2. What is the result of executing the following code snippet?

Assume all required libraries are included and no compile-time/runtime errors occur.

```
int main() {
    list<int> myList;
    for (int i=1; i<6; i++)
        myList.push_back(i);

    for (list<int>::iterator it = myList.begin(); it != myList.end(); it++ )
        *it = *it * 3;

    for (list<int>::iterator it = myList.begin(); it != myList.end(); it++ )
        cout << *it << " ";

    return 0;
}
```

- A. **[Correct Answer]** **[Your Answer]** 3 6 9 12 15
- B. 3 6 9 12
- C. 1 2 3 4 5
- D. None of the other options is correct.
- E. 1 2 3 4

3. Suppose we have implemented the Stack ADT as a singly-linked-list with head and tail pointers and no sentinels. Which of the following best describe the running times for the functions `push` and `pop`, assuming there are  $O(n)$  items in the list, and that the top of the Stack is at the tail of the list? o

- A.  $O(n)$  for both.
- B. None of the options is correct
- C. **[Correct Answer]** **[Your Answer]**  $O(1)$  for push and  $O(n)$  for pop.
- D.  $O(n)$  for push and  $O(1)$  for pop.
- E.  $O(1)$  for both.

4. We have implemented the Stack ADT as an array. Every time the array is full, you resize the array creating a new array that can hold 3 elements more than the previous array and copy values over from the old array. What is the total running time for  $n$  pushes to the stack.

- A.  $1/3 * O(n)$ .
- B. **[Your Answer]**  $O(n)$ .
- C.  $O(1)$ .
- D.  $O(\log n)$ .
- E. **[Correct Answer]**  $O(n^2)$ .

5. In implementing Stack ADT, using which of the following data structure gives worst asymptotic runtime for push? (Assume we require to push at the end of list or array)

- A. Doubly linked list with head and tail pointer.
- B. Singly linked list with head and tail pointer.
- C. All options provide the same runtime.
- D. **[Correct Answer]** Singly linked list with head pointer only.
- E. **[Your Answer]** Array (size of array larger than possible elements in stack).
